

Musanze Cooperative Harvest and Dispatch Decision Lab

UI/UX concept - Group AI-G05 - replace placeholders

A simple decision-support interface for cooperative staff

Stakeholder: Musanze potato cooperative staff who review harvest and dispatch operations.

DECISION 1
Is the input file safe to use?

DECISION 2
What harvest weight is expected?

DECISION 3
Does this consignment need review?

Design principle
Show recommendations clearly, but keep human review and override visible. Predictions are not guaranteed facts.

User journey and information flow

The interface follows the staff member's real decision sequence.

Arrows represent information flow, not automatic authority: the final action remains with the staff member.

Annotated wireframe: data quality review

The first screen answers: Can I trust this file enough to continue?

AI_A1_G05.csv [Choose file] [Validate]

1. Rows loaded dynamically

Missing values
0

Duplicates
0

Validation state: READY FOR REVIEW

Warnings identify missing columns, invalid values, or incomplete data.

[Review warnings]

A. File identity
Show filename and SHA-256 evidence.

B. Clear status
Use READY, REVIEW REQUIRED, or BLOCKED alongside

C. Actionable warnings
Tell staff what needs checking before continuing.

Annotated wireframe: prediction and dashboard

One selected record is explained in operational language.

Responsible AI states

The design makes uncertainty and human authority visible.

UNCERTAIN PREDICTION

Show probability and ask for manual review.

MISSING DATA

Explain which field is missing and block silent use.

MODEL LIMITATION

State that the model learns patterns from this dataset only.

HUMAN OVERRIDE

Allow override and capture the reason.

MANUAL REVIEW

Route the record to staff when evidence is insufficient.

Human decision statement

The system provides an AI recommendation. Staff may accept it, override it, or request manual review. A prediction is not a guaranteed fact.

Visual system and design rationale

Simple choices support non-technical cooperative staff.

Accessible labels

Use plain words, units, and short explanations. Avoid unexplained model jargon.

Colors and legends

Blue = information, green = ready, amber = review, red = warning. Every color state also has text.

Blue Information	Green Ready	Amber Review	Red Warning
---------------------	----------------	-----------------	----------------

Three important design decisions

1. Put data validation first so staff do not act on an invalid file.
2. Put prediction, probability, and units together so the recommendation is understandable.
3. Make accept, override, reason, and manual review visible so accountability remains human.

Legend rule

Do not rely only on color. Use headings, icons or symbols, and explanatory text for every warning or status.
